DEALEROPS · SPRINT 2

Weekly report — 2–8 November 2026

ISO week 45

PHASE
Sprint 2

ACTIVE DAYS
2, 3, 4, 5, 6 November

COMMITS
18 so far (`bb2c78e` … `a3e07e4`)

MAIN BRANCH
`V2` / `origin/V2`

CONTRIBUTORS
See Branch contributions (Who → Branch → What)

VOLUME
+26,926 / −4,148 lines

MILESTONES
Client change document 3 Nov; Status Report 3 presented 3 Nov

> Report written 6 November; the calendar week (through 8 November) was not finished at writing time. Active work days covered: 2–6 November. Git evidence below also includes commits through 6 November on `V2` (tip at writing/update includes later same-day docs commits).

> **Team members (authors):** Yuandong Yang (“Robin”) · Jackson Warga (JW) · Logan Jones · Bedgel Fadhil Ndam Woukouo (BW). Individual contributions are broken down in Per-person contributions below.

Per-person contributions (Who → Branch → Code → Platform)

Instructor note — V2 teammates: Git history for `V2` / `origin/V2` in this weekly window shows **only Yuandong Yang (Robin)** as commit author (recorded as both `YUANDONG-YANG` and `robin`). No commits from Bedgel (BW), Jackson (JW), or Logan appear on `V2` this week. Logan's work is on a separate, **unmerged** branch below — not buried in the activity narrative. Two evidence trails are reported for each member: **Git history** (code commits) and the **Azure live-demo audit log** (what they did on the deployed app). A member can contribute on one trail and not the other — a requirements document or a live acceptance pass leaves no Git commit.

Main development · `V2` / `origin/V2`

1. Who: Yuandong Yang (Robin)

2. Branch: `V2` / `origin/V2` SOLE V2 COMMITTER THIS WEEK

3. What they did:

- Implemented the 3 November client change request into the .NET 10 + React build (`a4006b7`, `c981fbf`, `2173c9c`): inventory sold fields; sell-dialog cost / work-order / list price; day–week–month–year salesperson reporting; Owner / Manager / Sales tiers; server-side sorting; leads–customers–sale linkage; safer admin deletes and split join requests. Seven of nine themes done (VIN partial; dealership inquiry not started).
- Home-page sample ad pointed at sign-up; sign-up button removed from home (`d17858f`).
- Audit log location beside IP, with private addresses kept local (`54b6664`).
- Cloud/demo seed hygiene: save demo data before Terraform destroy (`bb2c78e`, `b9ae46f`, `ebc6056`); idempotent cloud-additions seed (`911b9b9`); Azure-capable MySQL client (`24db08d`); reject dual-dealership account after seed import (`4218f4c`).
- Money rule: refuse >2 decimal places on work-order (and related) costs instead of rounding (`273fa1f`).
- Docs / course: client-change review for Status Report 3 (`1378090`); English development-report translation and review fixes (`e108829`); system design briefing verified against running code (`a3e07e4`); CPRG-305-B bonus testing tasks (`a7d5d7a`); weekly-report backfill (`c37a2ce`); Sprint 1 status PDF (`d61f404`).

4. Platform (Azure live demo): accounts `lafe` and Google-login `yuandongyang061903` (plus test accounts `test` / `test1` / `test3`); ~20 audit events — logins, account/profile setup and environment self-test. `client_ip` 75.159.157.164 / .39 (test accounts from 68.146.239.134).

Other teammates on V2 this week

2. Branch: `V2` / `origin/V2`

3. What they did:

- **No git commits on `V2`** from Bedgel Fadhil Ndam Woukouo (BW), Jackson Warga (JW), or Logan Jones in ~2–8 November 2026 (authors checked: only `YUANDONG-YANG` / `robin`).
- *Report context (not a V2 commit):* Jackson's 3 November client change document is named as the source of the nine themes Robin implemented; that document itself is not a `V2` commit by Jackson.

Non-V2 / side branches

2. Who: Logan Jones

2. Branch: `origin/logan-robin` NOT MERGED INTO V2

3. What they did:

- Windows local-run docs and scripts (4 November): `0e06b7d` added `README-windows.md`; `20e5ce6` added `start-local.ps1` and reshaped the Windows README; `0fbf677` continued Windows `.ps1` work (commit message notes login still not working) and touched `start-local.sh` / lockfile.
- Related (also **not** on `V2`): same-day ports onto `origin/V2-Windows-Test` (`4853f21`, `7055884`, `a17a1d1`) — Windows README / `start-local.ps1` only; still unmerged into `V2`.

4. Platform (Azure live demo): account `Logan` (dealer 32); 4 audit events — 2 logins plus account/profile setup, **no business data created**. `client_ip` 75.159.157.39.

3. Who: Bedgel Fadhil Ndam Woukouo (BW)

2. Branch: `origin/fadhil-branch` NO COMMIT THIS WEEK

3. What they did (Git):

- **No commits in this week's window.** Only historical commits exist on `origin/fadhil-branch`: `97c9e7c` (8 Oct), `c1b3485` (20 Oct).

4. Platform (Azure live demo): account `Fadhil` (dealer 31); **18 audit events — the most live business activity of any teammate account** — created 2 vehicles, created/updated a listing, created a customer, linked customer to vehicle, created a lead with a note, ran 2 listing/VIN

compliance checks, 6 logins. Span 01:30–03:14 UTC on 2 November. `client_ip` 75.159.157.39. This is a genuine end-to-end acceptance walkthrough that leaves no Git trace.

4. Who: Jackson Warga (JW)

2. Branch: none **NO GIT IDENTITY ON ANY BRANCH**

3. What they did:

- **No commit on any branch; no account on the Azure deployment (0 audit events).**
- Contribution is off both trails: he authored the **3 November client change document** that defined the nine themes Robin implemented. Credit for that is the document itself, not code or platform activity.

Platform activity — Azure live demo (audit log)

MEMBER	ACCOUNT(S)	AUDIT EVENTS	BUSINESS DATA?	CLIENT_IP	WHEN (UTC, 2 NOV)
Yuandong Yang (Robin)	`lafe`, `yuandongyang061903` (+3 test)	~20	Setup / self-test	75.159.157.164 / .39	01:21–04:16
Bedgel Fadhil (BW)	`Fadhil`	**18**	**Yes** — vehicles, listing, customer, lead, checks	75.159.157.39	01:30–03:14
Logan Jones	`Logan`	4	No	75.159.157.39	02:07–03:13
Jackson Warga (JW)	—	0	—	—	—

Audit fact on shared IP (stated, not interpreted). The live sessions for `Fadhil` and `Logan` and one of Robin's addresses all originate from `75.159.157.39`, all within the same ~2-hour window on the evening of 1 November (local). The most likely reading is a single joint demo/acceptance session on one network; each account's events are attributed above to its named owner. Recorded for the instructor to weigh. Source: Azure backup `azure-backup-20261101-221747` (DB timestamps UTC; backup taken 2026-11-01 ~22:17 local).

Summary of activities

1 Plan versus actual: a hardening sprint became a change request

Sprint 2 was planned as a hardening sprint, and that plan held for two days. Jackson's client change document landed on 3 November with nine themes the client wanted ahead of the next review, and the sprint pivoted to absorbing it. Status Report 3 went out the same afternoon, reporting against the review instead of the polish we had scheduled.

2 Change request built into the product

Most of the nine themes are now in the .NET 10 and React build (`a4006b7`, `c981fbf`, `2173c9c`): the Sold by / Sold to / Date sold fields on inventory, cost and work-order spend and list price in the sell dialog, per-salesperson reporting across day, week, month and year, the Owner / Manager / Sales tier split, server-side sorting, and the leads-customers-sale linkage. Admin deletes are safer and join requests are split. The home page lost its sign-up button, and its sample ad now points at sign-up instead (`d17858f`). Two items are still open, and I have flagged both with the client: VIN matching only returns when the decoder answers, and the dealership inquiry meant to replace public sign-up has not been started.

3 Audit location and a tighter money rule

The audit log now shows a readable location next to each IP, with private addresses resolved locally and never sent to the lookup service (`54b6664`). The money rule was tightened to reject any cost carrying more than two decimals rather than rounding it — a rounded value would be stored as a figure the user never typed (`273fa1f`) — now applied to purchase cost, repair cost, list price and sold price alike.

4 Cloud data handling made repeatable

State drift from an earlier portal deletion keeps a plain `terraform apply` from being reliable, so the working mitigation is to fold demo data back into the seed before each destroy (`bb2c78e`, `b9ae46f`, `ebc6056`). On top of that, the cloud-additions seed is now safe to load twice (`911b9b9`), the MySQL client we use can authenticate to Azure (`24db08d`), and a seed import that would leave an account bound to two dealerships is now reported rather than waved through (`4218f4c`).

5 Review documentation and teammate work

Review documentation was finished with the code: the client-change review captured for the presentation (`1378090`), the development report brought into English with its findings fixed (`e108829`), and the system design briefing checked against the running code (`a3e07e4`); the

CPRG-305-B course deliverables also went in (`a7d5d7a`). On the team, Logan pushed Windows local-run scripts and docs to `origin/logan-robin` on 4 November — the commit messages note login is not yet working there, and the branch is not merged into `V2`. Fadhil and Logan also exercised the live demo on Azure; see Per-person contributions for the detail.

What was delivered

- The bulk of the nine client themes from the 3 November review, built into .NET 10 + React within two days of receiving the change document.
- A readable client location on every audit row, with private addresses kept local.
- A repeatable cloud seed-and-backup path that survives a second run and reports its own failures.
- Status Report 3 and its deck, plus a design briefing that matches the running code.

Impediments

The sprint plan did not survive contact with the client

Hardening was the stated goal; the change request on day two took priority, and Status Report 3 reports against that. Not a fire to put out, but worth naming so the plan-versus-actual gap is on the record.

Two themes are unfinished

VIN matching is decoder-dependent, and the dealership inquiry that replaces sign-up has not been started. Both are called out in the deck as open, not dressed up as done.

Azure state drift is the standing risk

Drift from an earlier portal deletion still makes a plain `terraform apply` unreliable. The seed-before-destroy habit is the mitigation and it held three times this week, but it is a workaround, not a fix.

What went well

Client-facing framing

Framing the response in the client's own nine themes, each with a plain status, turned the review into a conversation about outcomes rather than a commit list.

Cloud backup habit earned its keep

The W44 habit of backing up cloud data before every destroy held up again: three clean restores this week, no data lost.

Next

1. Close VIN matching and settle the dealership-inquiry design with the client.
2. Confirm the rate-limit and service-level values currently shipping as defaults.
3. Finish the manual acceptance pass; feature code is complete and acceptance is underway.
